

NAME

seticon - Set icon of Mac OS X files.

SYNOPSIS

```
seticon [-vhd] [source] [file ...]
```

DESCRIPTION

seticon is a utility for setting a custom icon on Mac OS X files and folders via the command line. The first argument to seticon is the source file, i.e. the file with the icon you wish to apply to other file(s). Any arguments after the first should be files which you wish to give the custom icon to.

Please note that this need not be an .icns file -- see the -d option for using an .icns file as a source. seticon defaults to retrieving the actual icon of the file in question.

Typical usage would look like this:

```
seticon sourcefile file1 file2
```

The example above would result in the icon of sourcefile being applied to the files file1 and file2 as custom icons.

seticon supports the following options:

- d Use the data of the source file as icon instead of the source file's actual icon.
- v Print version and author
- h Print a short help text on program usage

FILES

/usr/local/bin/seticon
